

# Enhanced mind-matter interactions following rTMS induced frontal lobe inhibition

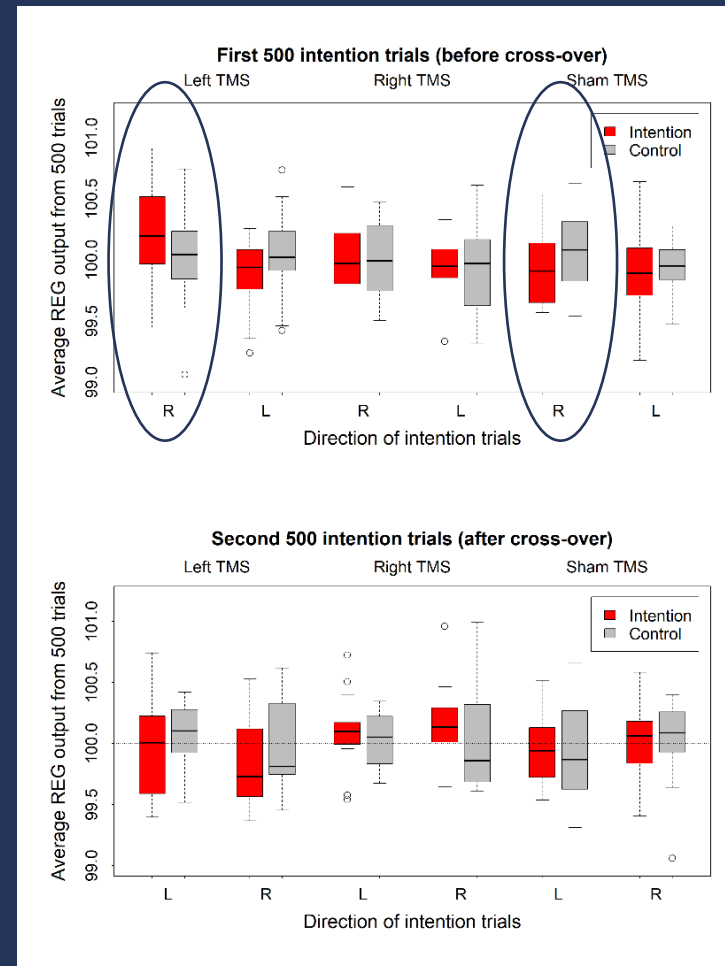

Reversible brain lesion produced through repetitive Transcranial Magnetic Stimulation (rTMS)

Random Event Generator (REG) produced 0s and 1s with equal probability

Numerical output translated into movement of an arrow on a computer screen to the right or left

## Conclusions

- Significant right intention effects found in healthy participants with reversible lesions in left medial middle frontal lobe
- Individuals with left frontal lesions may represent an **enriched sample** for better detection and replication of psi effects
