

PHYSIOLOGICAL CORRELATES TO VARIATIONS IN ULTRA-WEAK PHOTON EMISSION MEASUREMENTS DURING PERIODS OF FOCUSED INTENT (249/2020)

John G. Kruth
Rhine Research Center

Can people intentionally produce ultraviolet light during moments of focus?
(six-sigma evidence; $p < 2.2 \times 10^{-16}$)

Does physiology correlate with the production of light?
(Reduced blood flow, $r = -0.256$; increased heart rate, 60% of sessions;
more consistent heart rate, $r = -0.230$)

Is light a mechanism for energy healing & can we predict it from physiology?
